王燕武, *提高直接税有利于促进居民消费吗? ——中国经验的检验*, 工作论文, 2015.

Team Work:

My team and I built and developed the China Quarterly Macroeconomic Model (CQMM) in 2005. It is a demand-driven structural model for short-term forecasting and policy simulation. It was first put into operation in the August of 2006. And so far, CQMM has been running for ten years.

Efforts have been made to take into account the special features of China's transitional economy in all the behavioral equations. The latest CQMM model has 27 equations, 38 endogenous variables and 25 exogenous variable, including five blocks: consumption, investment, foreign trade, price indices and macro-policies. We release the main indicators of China's economic forecast twice a year. Based on this model, we have achieved fruitful results.

**From 2014, we start to hold the forecast Conference abroad.
In 2014, we went to Heidelberg in Germany:**

In 2015, we went to Kobe University in Japan:

And this September, we plan to go to Australian National University in Australia.
